# EASTERN UNIVERSITY, SRI LANKA <br> Faculty of Commerce and Management FOURTH YEAR SECOND SEMESTER EXAMINATION IN ECONOMICS 2005/06 

## November 2007

## ECN - 4033 Economic Analysis and Problems

Answer all Question
Time: 3 hours

1. Distinguish between the followings
i. General Equilibrium and Partial Equilibrium
ii. Neo classical and paretian welfare economics
iii. Economic static and Dynamics
iv. Stable and unstable Equilibrium
( 20 Marks)
2. i. Explain the various types of qualitative forecasting methods
$\stackrel{*}{6}$
( 5 Marks)
ii. The following table shows the sales of gasoline in India (thousands of barrels)
from the first quarter 2003 to the last quarter 2006

| Year | Sales | Year | Sales | Year | Sales | Year | Sales |
| ---: | :---: | ---: | :---: | ---: | :---: | ---: | :---: |
| $2003-1$ | 22.434 | $2004-1$ | 22.662 | $2005-1$ | 22.776 | $2006-1$ | 23.302 |
| 2 | 23.766 | 2 | 24.032 | 2 | 24.491 | 2 | 24.045 |
| 3 | 23.860 | 3 | 24.171 | 3 | 24.751 | 3 | 25.437 |
| 4 | 23.391 | 4 | 23.803 | 4 | 24.170 | 4 | 25.272 |

Regression equation for gasoline sales ( St ) on time is

$$
S t=22.902+117.06 t \quad\left(R^{2}=0.42\right)
$$

a. Find the forecasted values of gasoline sales for each quarter
b. Calculate the seasonal adjusted forecasts of gasoline for each quarter
c. What is the seasonal adjusted forecast of gasoline in the first quarter 2007 ?
3. i. Describe the properties of a Cobb Douglas Production function.
ii. Suppose that a firm uses labour (L) and Capital (K) in production want to determine the amount of labour and capital in order to maximize the output (Q) with the given cost (C)

$$
\begin{gathered}
\operatorname{Max} \quad \mathbf{Q}=\mathbf{f}(\mathbb{K}, \mathrm{L}) \\
\mathrm{C}=\mathrm{w} \cdot \mathrm{~L}+\mathbf{r} \cdot \mathbf{K} \\
\text { (w- Wage of labour }, r \text { - Price of capital) }
\end{gathered}
$$

Prove that

is the necessary condition for the output maximization
iii. A hypothetical Cobb Douglas Production function and cost function are giyen below

$$
\begin{aligned}
Q & =100 \mathbb{K}^{0.5} \mathbb{L}^{0.5} \\
1200 & =30 \mathbb{L}+40 \mathbb{K}
\end{aligned}
$$

Fine the optimum combination of Labour and Capital for the maximum level of output.
( 4 Marks)
4. The following table shows the input -output table for a simple economy composed of three sectors $\mathrm{A}, \mathrm{B}$ and C .

| Supply <br> Sectors | Producing industries |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{A}$ | $\mathbf{B}$ | $\mathbf{C}$ | FD | Total |
| A | 20 | 60 | 30 | 90 | $\mathbf{2 0 0}$ |
| $\mathbf{B}$ | 80 | 90 | 20 | 110 | $\mathbf{3 0 0}$ |
| C | 40 | 30 | 10 | 20 | $\mathbf{1 0 0}$ |
| Value added | 60 | 120 | 40 | - | $\mathbf{2 2 0}$ |
| Total | $\mathbf{2 0 0}$ | $\mathbf{3 0 0}$ | $\mathbf{1 0 0}$ | $\mathbf{2 2 0}$ | $\mathbf{8 2 0}$ |

a. Find the input coefficient matrix for the above model.
b. Fine the Balanced Equations for three industries
c. Suppose that final demand for the output of industry A is increased from 90 to 100 . find the new total output of industries $A, B$ and $C$
5. Use the Simplex method to solve the following LP problem

Maximize $Z=3 X_{1}+5 X_{2}+4 X_{3}$

Subject to:

$$
\begin{align*}
2 \mathrm{X}_{1}+3 \mathrm{X}_{2} & \leq 8 \\
2 \mathrm{X}_{2}+5 \mathrm{X}_{3} & \leq 10 \\
3 \mathrm{X}_{1}+2 \mathrm{X}_{2}+4 \mathrm{X}_{3} & \leq 15 \\
\mathrm{X}_{1}, X_{2}, X_{3} & \geq 0 \tag{20Marks}
\end{align*}
$$
