ABSTRACT

Impact of sulphur on the performance of young rubber during the immature period was evaluated in relation to the continuous use of urea, sulphate of ammonia based N,P,K and N,P,K,Mg fertilizer mixture and sulphur containing Kieserite recommended by the Rubber Research Institute of Sri Lanka.

Application of sulphur in the form of Kieserite with Urea significantly increased the plant girth.

A significant relationship was evident between amount of added sulphur and girth of young plants indicating that sulphur is a limiting factor for some of the vigorously grown clones recommended by Rubber Research Institute.

LIST OF TABLES	vi
LIST OF FIGURES	vii
1 INTRODUCTION	1
2 REVIEW OF LITERATURE	3
2.1 Sulphur	3
2.1.1 General introduction of sulphur	3
2.1.2 Occurrence of sulphur	4
2.1.2.1 Mineralogy of sulphur	4
2.1.2.2 Sulphur transformation in soil	5
2.1.2.3 Sulphur mineralization and immobilization	5
2.1.2.4 Sulphur volatilization	7
2.1.3 Availability of sulphur in soil	7
2.1.4 Source of sulphur	8
2.1.4.1 Sulphur in atmosphere	8
2.1.4.2 Sulphur in water	10
2.1.4.3 Sulphur in soil	10
2.1.4.4 Sulphur in fertilizers	11

2.1.5	Sulphur in plants	13
2.1.5.1	Forms of sulphur in plants	13
2.1.5.2	Amount of sulphur in plants	14
2.1.5.3	Sulphur in Hevea	15
2.1.6	Sulphur in rubber soil in Srilanka	15
2.1.7	Importance of sulphur in plant growth	16
2.1.8	Sulphur deficiency	17
2.1.8.1	Sulphur deficiency in Hevea leaf	17
2.1.9	Nurient cycle of a rubber plantation	19
2.1.9.1	Transfer of nutrient between soil and vegetation	19
