ABSTRACT.

There are many resources in a country. But those are scarce in nature. When we consider it to the human needs, this is scarce in nature. This is questionable whether these scarce resources are used in an efficient and effective manner. This study identified these as a base. The title of this study is A strategic plan for the efficient utilization of metal (rocks) in Trincomalee Town and Gravets Divisional Secretariate Division. Through this study we can identify, whether these resources are used in an efficient and effective way in Trincomalee District.

In this study data are collected through 100 structured questionnaires, these questionnaires issued through the random basis to the suppliers and customers who are who are residence around the Town and Gravets. And also from interviewing the officers the data were collected.

Through this study I can identify some problems that are here many rocks are as unused that is some the rocks are not identified, alternative resources are not used, uncontrolled of the local use, unreserved for future use.

Therefore the problems in metal resource usage in Trincomalee District and the reason for these problems are found and the recommendations are put forward. If the metal resources are used by take into consideration the above problems and recommendations it can be get full utilization from this resource and can be used for long term.

This study helps the suppliers and customers to put forward their problems and helps the officers to give their expectations and opinion relating to metal resource utilization. I believe that this research will be useful for the efficient utilization of metal resource and eventually it leads to the regional development at Trincomalee.
