ABSTRACT

Sri Lanka is one of the popular and important Agricultural countries in South Asia. We can say that the irrigation system prevails here contains several major tanks and minor tanks.

Among the major ones Pavatkulam in Vavuniya District plays a considerable part in that area. But due to the lack of proper management there remain a lot of problems.

So there is a need for a proper management to receive the highest produce. Identifying the problems regarding this, putting forward solutions is a must. Then only we can bring about a turning point in using the tank for paddy cultivation.

If the renovation and maintenance is effective and reduction in wastage, removal of obstruction, effective and delegation of management training system effectively expanding the activities of department offices leads to efficient and effective management of "Pavatkulam major water tank".

So, this research has been done to overcome the remaining problems. This book contains five chapters which express how the research has been done and in the end there are recommendations and solutions which come from my view.
